NYC LL84 ML

Eden Axelrad

7/17/2022

Contents

SECTION 1: Introduction and Overview

- Data retrieved from NYC Open Data as part of Local Law 84 (LL84)
- Data described as Data and metrics on water and energy consumption in privately owned buildings over 25,000 ft2 and in City-owned buildings over 10,000 ft2.
- R script used to retrieve, wrangle, and clean the data frame used in this main report can be found in the repo, or accessed via this link.

SECTION 2: Setup

In this section we set up the initial data set

```
# Load the cleaned up data for reporting years 2016 through 2019
NYC_LL84 <- read.csv("Data/NYC_LL84_Clean.csv")

# Create our test and train data for machine learning from reporting years 2016-18
NYC_LL84_ML <- NYC_LL84 %>%
  filter(year %in% c("2016", "2017", "2018")) %>%
  select(year, primary_property_type, year_built,
         number_of_buildings, energy_star_score, property_gfa, parking_gfa,
         leed_project, CDD, HDD, MeanMaxTemp, MeanMinTemp, site_eui)

# Create the validation set to be used in the very end
NYC_LL84_Validation <- NYC_LL84 %>%
```

```
  filter(year == "2019") %>%
  select(year, primary_property_type, year_built,
         number_of_buildings, energy_star_score, property_gfa, parking_gfa,
         leed_project, CDD, HDD, MeanMaxTemp, MeanMinTemp, site_eui)
```

SECTION 3: Methods / Analysis

This section explains the process and techniques used, including data cleaning, data exploration and visualization, insights gained, and modeling approach

SECTION 3.1: Exploratory Analysis

```
# Summary of data frame
glimpse(NYC_LL84_ML)
```

```
## Rows: 34,470

SECTION 3.2: Actual Methods

insert text

```r
# Partition the data in to a test set with 20% and train set with 80%
# Set seed to 92 for reproducing results
set.seed(92, sample.kind = "Rounding")
test_index <- createDataPartition(NYC_LL84_ML$site_eui,
                                  times = 1, p = 0.2, list = FALSE)
test_set <- NYC_LL84_ML %>% slice(test_index)
train_set <- NYC_LL84_ML %>% slice(-test_index)
```

```r

### Method #1: Naive Model
# Start off with a naive model that uses the average rating to predict movie ratings
mu_hat <- mean(train_set$site_eui)
```

```r
rmse_naive <- RMSE(pred = mu_hat,
                   obs = test_set$site_eui)
```

Method #1: Naive Model

Method #2: Mean EUI by Property Type In the field, this is a common way of improving an estimate for EUI or GHG emissions. For this reason, I wanted to include it alongside the other methods. To execute it, simply find the average EUI by property type and left join with the test set. The assumption here is that property type is an easy way to break down the data in to categories that significantly impact EUI.

```r
### Method #2: Using average EUI by property type

pred_eui_avg <- left_join(test_set,
                          train_set %>%
                            group_by(primary_property_type) %>%
                            summarize(pred_avg_eui = mean(site_eui)),
                          by = "primary_property_type") %>%
  .$pred_avg_eui

rmse_eui_avg <- RMSE(pred_eui_avg,
                     obs = test_set$site_eui,
                     na.rm = TRUE)
```

```r
### Method #3: Linear Regression with Energy Star Score
# Create a linear model
set.seed(92, sample.kind = "Rounding")
```

Method #3: Simple Linear Regression Using ENERGY STAR Score

```
## Warning in set.seed(92, sample.kind = "Rounding"): non-uniform 'Rounding'
## sampler used
```

```r
model_lr <- train(site_eui ~ energy_star_score,
                  data = train_set,
                  method = "lm")

model_lr
```

```
## Linear Regression
##
## 27575 samples
##     1 predictor
##
## No pre-processing
## Resampling: Bootstrapped (25 reps)
## Summary of sample sizes: 27575, 27575, 27575, 27575, 27575, 27575, ...
## Resampling results:
```

```
##
##   RMSE      Rsquared  MAE
##   33.38022  0.434889  18.93076
##
## Tuning parameter 'intercept' was held constant at a value of TRUE
```

```r
# Generate predicted Site EUI using the test set
pred_lr <- predict(model_lr,
                newdata = test_set %>%
                  select(site_eui, energy_star_score))

# Save the model RMSE
rmse_lr <- RMSE(pred = pred_lr,
                    obs = test_set$site_eui,
                    na.rm = TRUE)
```

```r
### Method #4: Multiple Linear Regression with all variables
# Create a linear model
set.seed(92, sample.kind = "Rounding")
model_mlr <- train(site_eui ~ .,
                   trControl = trainControl(method = "repeatedcv", repeats = 3),
                   data = train_set,
                   method = "lm")
